

AVIRTEK Awarded \$1.5 Million to Develop Autonomic Security Operations Center (ASoC) (September 2019- September 2021) (AFRL and US Army)

AVIRTEK, Inc., is pioneering the development of cybersecurity products that can self-protect entire networks and beyond (users, computers, networks, data and applications) from any type of cyberattack. AVIRTEK announced today its largest product development award, received from the U.S. Air Force and Army. The award will allow AVIRTEK's ASoC technology to secure and protect their datacenters.

The ASoC will deliver automated and intelligent data analytics to guarantee that any data source being used by any Department of Defense (DoD) application is trustworthy, regardless of the data origin (internal or external) or the type of data (text, image, audio, video, etc.). The ASoC will not only detect the existence of malicious components embedded in data objects, but will also provide intelligent capabilities to identify both the exact locations of malicious components and the safest methods to remove the malicious components from the compromised data objects.
